Sorting with Lists and Trees

For simplicity we sort natural numbers.

Sorting with lists

The task is to define insertion sort and prove its correctness. The following functions are required:

```
consts
  insort :: "nat ⇒ nat list ⇒ nat list"
  sort   :: "nat list ⇒ nat list"
  le     :: "nat ⇒ nat list ⇒ bool"
  sorted :: "nat list ⇒ bool"
```

In your definition, `ex.insort x xs` should insert a number `x` into an already sorted list `xs`, and `ex.sort ys` should build on `insort` to produce the sorted version of `ys`.

To show that the resulting list is indeed sorted we need a predicate `ex.sorted` that checks if each element in the list is less or equal to the following ones; `le n xs` should be true iff `n` is less or equal to all elements of `xs`.

Start out by showing a monotonicity property of `le`. For technical reasons the lemma should be phrased as follows:

lemma `[simp]: "x ≤ y ⟹ le y xs ⟶ le x xs"`

Now show the following correctness theorem:

theorem `"sorted (sort xs)"`

This theorem alone is too weak. It does not guarantee that the sorted list contains the same elements as the input. In the worst case, `ex.sort` might always return `[]` – surely an undesirable implementation of sorting.

Define a function `count xs x` that counts how often `x` occurs in `xs`.

Show that

theorem `"count (sort xs) x = count xs x"`

Sorting with trees

Our second sorting algorithm uses trees. Thus you should first define a data type *bintree* of binary trees that are either empty or consist of a node carrying a natural number and two subtrees.

Define a function *tsorted* that checks if a binary tree is sorted. It is convenient to employ two auxiliary functions *tge*/*tle* that test whether a number is greater-or-equal/less-or-equal to all elements of a tree.

Finally define a function *tree_of* that turns a list into a sorted tree. It is helpful to base *tree_of* on a function *ins n b* that inserts a number *n* into a sorted tree *b*.

Show

theorem *[simp]: "tsorted (tree_of xs)"*

Again we have to show that no elements are lost (or added). As for lists, define a function *tcount x b* that counts the number of occurrences of the number *x* in the tree *b*.

Show

theorem *"tcount (tree_of xs) x = count xs x"*

Now we are ready to sort lists. We know how to produce an ordered tree from a list. Thus we merely need a function *list_of* that turns an (ordered) tree into an (ordered) list. Define this function and prove

theorem *"sorted (list_of (tree_of xs))"*
theorem *"count (list_of (tree_of xs)) n = count xs n"*

Hints:

- Try to formulate all your lemmas as equations rather than implications because that often simplifies their proof. Make sure that the right-hand side is (in some sense) simpler than the left-hand side.
- Eventually you need to relate *sorted* and *tsorted*. This is facilitated by a function *ge* on lists (analogously to *tge* on trees) and the following lemma (that you will need to prove):

  ex.sorted (a @ x # b) = (ex.sorted a ∧ ex.sorted b ∧ ge x a ∧ le x b)
