## Lists

### Quantifying Lists

Define a universal and an existential quantifier on lists using primitive recursion. Expression  $\mathit{alls} P xs$  should be true iff  $P x$  holds for every element  $x$  of  $xs$ , and  $\mathit{exs} P xs$  should be true iff  $P x$  holds for some element  $x$  of  $xs$ .

**consts**

```
 $\mathit{alls} :: "(a \Rightarrow bool) \Rightarrow 'a list \Rightarrow bool"$   
 $\mathit{exs}  :: "(a \Rightarrow bool) \Rightarrow 'a list \Rightarrow bool"$ 
```

Prove or disprove (by counterexample) the following theorems. You may have to prove some lemmas first.

Use the `[simp]`-attribute only if the equation is truly a simplification and is necessary for some later proof.

**lemma**  $\mathit{alls} (\lambda x. P x \wedge Q x) xs = (\mathit{alls} P xs \wedge \mathit{alls} Q xs)$

**lemma**  $\mathit{alls} P (\mathit{rev} xs) = \mathit{alls} P xs$

**lemma**  $\mathit{exs} (\lambda x. P x \wedge Q x) xs = (\mathit{exs} P xs \wedge \mathit{exs} Q xs)$

**lemma**  $\mathit{exs} P (\mathit{map} f xs) = \mathit{exs} (P \circ f) xs$

**lemma**  $\mathit{exs} P (\mathit{rev} xs) = \mathit{exs} P xs$

Find a (non-trivial) term  $Z$  such that the following equation holds:

**lemma**  $\mathit{exs} (\lambda x. P x \vee Q x) xs = Z$

Express the existential via the universal quantifier –  $\mathit{exs}$  should not occur on the right-hand side:

**lemma**  $\mathit{exs} P xs = Z$

Define a primitive-recursive function  $\mathit{is\_in} x xs$  that checks if  $x$  occurs in  $xs$ . Now express  $\mathit{is\_in}$  via  $\mathit{exs}$ :

**lemma**  $\mathit{is\_in} a xs = Z$

Define a primitive-recursive function  $\mathit{nodups} xs$  that is true iff  $xs$  does not contain duplicates, and a function  $\mathit{del\dups} xs$  that removes all duplicates. Note that  $\mathit{del\dups} [x, y, x]$  (where  $x$  and  $y$  are distinct) can be either  $[x, y]$  or  $[y, x]$ .

Prove or disprove (by counterexample) the following theorems.

```
lemma "length (deldups xs) <= length xs"  
lemma "nodups (deldups xs)"  
lemma "deldups (rev xs) = rev (deldups xs)"
```
