

The Constructible Universe and the Relative Consistency of the Axiom of Choice

Lawrence C Paulson

April 19, 2009

Abstract

Gödel's proof of the relative consistency of the axiom of choice [1] is one of the most important results in the foundations of mathematics. It bears on Hilbert's first problem, namely the continuum hypothesis, and indeed Gödel also proved the relative consistency of the continuum hypothesis. Just as important, Gödel's proof introduced the *inner model* method of proving relative consistency, and it introduced the concept of *constructible set*. Kunen [2] gives an excellent description of this body of work.

This Isabelle/ZF formalization demonstrates Gödel's claim that his proof can be undertaken without using metamathematical arguments, for example arguments based on the general syntactic structure of a formula. Isabelle's automation replaces the metamathematics, although it does not eliminate the requirement at least to state many tedious results that would otherwise be unnecessary.

This formalization [4] is by far the deepest result in set theory proved in any automated theorem prover. It rests on a previous formal development of the reflection theorem [3].

Contents

1	First-Order Formulas and the Definition of the Class L	10
1.1	Internalized formulas of FOL	10
1.2	Dividing line between primitive and derived connectives . .	12

1.7 Internalized Formulas for the Ordinals

The *sats* theorems below differ from the usual form in that they include an element of absoluteness. That is, they relate internalized formulas to real concepts such as the subset relation, rather than to the relativized concepts defined in theory *Relative*. This lets us prove the theorem as *Ords_in_DPow* without first having to instantiate the locale *M_trivial*. Note that the present theory does not even take *Relative* as a parent.

1.7.1 The subset relation

definition

```

subset_fm :: "[i,i]=>i" where
  "subset_fm(x,y) == Forall(Implies(Member(0,succ(x)), Member(0,succ(y))))"

   ==> strong_replacement(M, %x y. P(x,y)) <->
       strong_replacement(M, %x y. P'(x,y))"
by (simp add: strong_replacement_def)

```

The extensionality axiom

```

lemma "extensionality(λx. x ∈ univ(0))"
apply (simp add: extensionality_def)
apply (blast intro: univ0_downwards_mem)
done

```

The separation axiom requires some lemmas

```

lemma Collect_in_Vfrom:
  "[| X ∈ Vfrom(A,j); Transset(A) |] ==> Collect(X,P) ∈ Vfrom(A,
succ(j))"
apply (drule Transset_Vfrom)
apply (rule subset_mem_Vfrom)
apply (unfold Transset_def, blast)

```

done

```
lemma Collect_in_VLimit:
  "[| X ∈ Vfrom(A,i); Limit(i); Transset(A) |]
   ==> Collect(X,P) ∈ Vfrom(A,i)"
apply (rule Limit_VfromE, assumption+)
apply (blast intro: Limit_has_succ VfromI Collect_in_Vfrom)
done
```

```
lemma Collect_in_univ:
  "[| X ∈ univ(A); Transset(A) |] ==> Collect(X,P) ∈ univ(A)"
by (simp add: univ_def Collect_in_VLimit Limit_nat)
```

```
lemma "separation(λx. x ∈ univ(0), P)"
apply (simp add: separation_def, clarify)
apply (rule_tac x = "Collect(z,P)" in bexI)
apply (blast intro: Collect_in_univ Transset_0)+
done
```

Unordered pairing axiom

```
lemma "upair_ax(λx. x ∈ univ(0))"
apply (simp add: upair_ax_def upair_def)
apply (blast intro: doubleton_in_univ)
done
```

Union axiom

```
lemma "Union_ax(λx. x ∈ univ(0))"
apply (simp add: Union_ax_def big_union_def, clarify)
apply (rule_tac x="⋃x" in bexI)
  apply (blast intro: univ0_downwards_mem)
apply (blast intro: Union_in_univ Transset_0)
done
```

Powerset axiom

```
lemma Pow_in_univ:
  "[| X ∈ univ(A); Transset(A) |] ==> Pow(X) ∈ univ(A)"
apply (simp add: univ_def Pow_in_VLimit Limit_nat)
done
```

```
lemma "power_ax(λx. x ∈ univ(0))"
apply (simp add: power_ax_def powerset_def subset_def, clarify)

done

```

```

lemma "replacement( $\lambda x. x \in \text{univ}(0), P)$ "
apply (simp add: replacement_def, clarify)
oops

```

no idea: maybe prove by induction on the rank of A?

Still missing: Replacement, Choice

2.4 Lemmas Needed to Reduce Some Set Constructions to Instances of Separation

```

lemma image_iff_Collect: "r `` A = {y  $\in$  Union(Union(r)).  $\exists p \in r. \exists x \in A. p = \langle x, y \rangle$ }"
apply (rule equalityI, auto)
apply (simp add: Pair_def, blast)
done

```

```

lemma vimage_iff_Collect:
  "r -`` A = {x  $\in$  Union(Union(r)).  $\exists p \in r. \exists y \in A. p = \langle x, y \rangle$ }"
apply (rule equalityI, auto)
apply (simp add: Pair_def, blast)
done

```

These two lemmas lets us prove *domain_closed* and *range_closed* without new instances of separation

```

lemma domain_eq_vimage: "domain(r) = r -`` Union(Union(r))"
apply (rule equalityI, auto)
apply (rule vimageI, assumption)
apply (simp add: Pair_def, blast)
done

```

```

lemma range_eq_image: "range(r) = r `` Union(Union(r))"
apply (rule equalityI, auto)
apply (rule imageI, assumption)
apply (simp add: Pair_def, blast)
done

```

```

lemma replacementD:
  "[| replacement(M,P); M(A); univalent(M,A,P) |]
   ==>  $\exists Y[M]. (\forall b[M]. ((\exists x[M]. x \in A \ \& \ P(x,b)) \rightarrow b \in Y))"$ 
by (simp add: replacement_def)

```

```

lemma strong_replacementD:
  "[| strong_replacement(M,P); M(A); univalent(M,A,P) |]

```

```

    ==>  $\exists Y[M]. (\forall b[M]. (b \in Y \leftrightarrow (\exists x[M]. x \in A \ \& \ P(x,b))))$ "
  by (simp add: strong_replacement_def)

```

lemma separationD:

```

  "[| separation(M,P); M(z) |] ==>  $\exists y[M]. \forall x[M]. x \in y \leftrightarrow x \in z \ \& \ P(x)$ "
  by (simp add: separation_def)

```

More constants, for order types

definition

```

  order_isomorphism :: "[i=>o,i,i,i,i,i] => o" where
    "order_isomorphism(M,A,r,B,s,f) ==
      bijection(M,A,B,f) &
      ( $\forall x[M]. x \in A \rightarrow (\forall y[M]. y \in A \rightarrow$

          pair(M,x,y,p) --> fun_apply(M,f,x,fx) --> fun_apply(M,f,y,fy)
        -->
          pair(M,fx,fy,q) --> (p ∈ r <-> q ∈ s))))"

```

definition

```

  pred_set :: "[i=>o,i,i,i,i,i] => o" where
    "pred_set(M,A,x,r,B) ==
       $\forall y[M]. y \in B \leftrightarrow (\exists p[M]. p \in r \ \& \ y \in A \ \& \ \text{pair}(M,y,x,p))$ "

```

definition

```

  membership :: "[i=>o,i,i,i] => o" where — membership relation
    "membership(M,A,r) ==
       $\forall p[M]. p \in r \leftrightarrow (\exists x[M]. x \in A \ \& \ (\exists y[M]. y \in A \ \& \ x \in y \ \& \ \text{pair}(M,x,y,p)))$ "

```

2.5 Introducing a Transitive Class Model

The class M is assumed to be transitive and to satisfy some relativized ZF axioms

```

  locale M_trivial =
    fixes M
    assumes transM:      "[| y ∈ x; M(x) |] ==> M(y)"
      and upair_ax:      "upair_ax(M)"
      and Union_ax:      "Union_ax(M)"
      and power_ax:      "power_ax(M)"
      and replacement:   "replacement(M,P)"
      and M_nat [iff]:   "M(nat)"

```

Automatically discovers the proof using transM, nat_0I and M_nat.

```

  lemma (in M_trivial) nonempty [simp]: "M(0)"
  by (blast intro: transM)

```

```

  lemma (in M_trivial) rall_abs [simp]:
    "M(A) ==> ( $\forall x[M]. x \in A \rightarrow P(x)$ ) <-> ( $\forall x \in A. P(x)$ )"

```

```
by (blast intro: transM)
```

```
lemma (in M_trivial) rex_abs [simp]:
  "M(A) ==> (∃ x[M]. x∈A & P(x)) <-> (∃ x∈A. P(x))"
by (blast intro: transM)
```

```
lemma (in M_trivial) ball_iff_equiv:
  "M(A) ==> (∀ x[M]. (x∈A <-> P(x))) <->
    (∀ x∈A. P(x)) & (∀ x. P(x) --> M(x) --> x∈A)"
by (blast intro: transM)
```

Simplifies proofs of equalities when there's an iff-equality available for rewriting, universally quantified over M. But it's not the only way to prove such equalities: its premises $M(A)$ and $M(B)$ can be too strong.

```
lemma (in M_trivial) M_equalityI:
  "[| !!x. M(x) ==> x∈A <-> x∈B; M(A); M(B) |] ==> A=B"
by (blast intro!: equalityI dest: transM)
```

2.5.1 Trivial Absoluteness Proofs: Empty Set, Pairs, etc.

```
lemma (in M_trivial) empty_abs [simp]:

3 Relativized Wellorderings

theory Wellorderings imports Relative begin

We define functions analogous to *ordermap ordertype* but without using recursion. Instead, there is a direct appeal to Replacement. This will be the basis for a version relativized to some class *M*. The main result is Theorem I 7.6 in Kunen, page 17.

3.1 Wellorderings

definition

```

irreflexive :: "[i=>o,i,i]=>o" where
  "irreflexive(M,A,r) ==  $\forall x[M]. x \in A \rightarrow \langle x, x \rangle \notin r$ "

```

definition

```

transitive_rel :: "[i=>o,i,i]=>o" where
  "transitive_rel(M,A,r) ==
     $\forall x[M]. x \in A \rightarrow (\forall y[M]. y \in A \rightarrow (\forall z[M]. z \in A \rightarrow$ 
       $\langle x, y \rangle \in r \rightarrow \langle y, z \rangle \in r \rightarrow \langle x, z \rangle \in r))$ "

```

definition

```

linear_rel :: "[i=>o,i,i]=>o" where
  "linear_rel(M,A,r) ==
     $\forall x[M]. x \in A \rightarrow (\forall y[M]. y \in A \rightarrow \langle x, y \rangle \in r \mid x=y \mid \langle y, x \rangle \in r)$ "

```

definition

```

wellfounded :: "[i=>o,i]=>o" where
  — EVERY non-empty set has an r-minimal element
  "wellfounded(M,r) ==
     $\forall x[M]. x \neq 0 \rightarrow (\exists y[M]. y \in x \ \& \ \sim(\exists z[M]. z \in x \ \& \ \langle z, y \rangle \in r))$ "

```

definition

```

wellfounded_on :: "[i=>o,i,i]=>o" where
  — every non-empty SUBSET OF A has an r-minimal element
  "wellfounded_on(M,A,r) ==
     $\forall x[M]. x \neq 0 \rightarrow x \subseteq A \rightarrow (\exists y[M]. y \in x \ \& \ \sim(\exists z[M]. z \in x \ \& \ \langle z, y \rangle \in r))$ "

7 Closed Unbounded Classes and Normal Functions

theory Normal imports Main begin

One source is the book

Frank R. Drake. *Set Theory: An Introduction to Large Cardinals*. North-Holland, 1974.

7.1 Closed and Unbounded (c.u.) Classes of Ordinals

definition

```
Closed :: "(i=>o) => o" where
  "Closed(P) ==  $\forall I. I \neq 0 \rightarrow (\forall i \in I. \text{Ord}(i) \wedge P(i)) \rightarrow P(\bigcup(I))"$ 
```

definition

```
Unbounded :: "(i=>o) => o" where
  "Unbounded(P) ==  $\forall i. \text{Ord}(i) \rightarrow (\exists j. i < j \wedge P(j))"$ 
```

definition

```
Closed_Unbounded :: "(i=>o) => o" where
  "Closed_Unbounded(P) == Closed(P)  $\wedge$  Unbounded(P)"
```

7.1.1 Simple facts about c.u. classes

lemma ClosedI:

```
"[| !!I. [| I  $\neq$  0;  $\forall i \in I. \text{Ord}(i) \wedge P(i)$  |] ==> P( $\bigcup(I)$ ) |]
==> Closed(P)"
```

by (simp add: Closed_def)

lemma ClosedD:

```
"[| Closed(P); I  $\neq$  0; !!i. i  $\in$  I ==> Ord(i); !!i. i  $\in$  I ==> P(i) |]
==> P( $\bigcup(I)$ )"
```

by (simp add: Closed_def)

lemma UnboundedD:

```
"[| Unbounded(P); Ord(i) |] ==>  $\exists j. i < j \wedge P(j)"$ 
```

by (simp add: Unbounded_def)

lemma Closed_Unbounded_imp_Unbounded: "Closed_Unbounded(C) ==> Unbounded(C)"

by (simp add: Closed_Unbounded_def)

The universal class, V, is closed and unbounded. A bit odd, since C. U. concerns only ordinals, but it's used below!

theorem Closed_Unbounded_V [simp]: "Closed_Unbounded($\lambda x. \text{True}$)"

by (unfold Closed_Unbounded_def Closed_def Unbounded_def, blast)

The class of ordinals, Ord, is closed and unbounded.

```

theorem Closed_Unbounded_Ord [simp]: "Closed_Unbounded(Ord)"
by (unfold Closed_Unbounded_def Closed_def Unbounded_def, blast)

```

The class of limit ordinals, *Limit*, is closed and unbounded.

```

theorem Closed_Unbounded_Limit [simp]: "Closed_Unbounded(Limit)"
apply (simp add: Closed_Unbounded_def Closed_def Unbounded_def Limit_Union,

      clarify)
apply (rule_tac x="i++nat" in exI)
apply (blast intro: oadd_lt_self oadd_LimitI Limit_nat Limit_has_0)
done

```

The class of cardinals, *Card*, is closed and unbounded.

```

theorem Closed_Unbounded_Card [simp]: "Closed_Unbounded(Card)"
apply (simp add: Closed_Unbounded_def Closed_def Unbounded_def Card_Union)
apply (blast intro: lt_csucc Card_csucc)
done

```

7.1.2 The intersection of any set-indexed family of c.u. classes is c.u.

The constructions below come from Kunen, *Set Theory*, page 78.

```

locale cub_family =
  fixes P and A
  fixes next_greater — the next ordinal satisfying class A
  fixes sup_greater — sup of those ordinals over all A
  assumes closed: "a ∈ A ==> Closed(P(a))"
    and unbounded: "a ∈ A ==> Unbounded(P(a))"
    and A_non0: "A ≠ 0"
  defines "next_greater(a,x) == μ y. x < y ∧ P(a,y)"
    and "sup_greater(x) == ⋃ a ∈ A. next_greater(a,x)"

```

Trivial that the intersection is closed.

```

lemma (in cub_family) Closed_INT: "Closed(λx. ∀ i ∈ A. P(i,x))"
by (blast intro: ClosedI ClosedD [OF closed])

```

All remaining effort goes to show that the intersection is unbounded.

```

lemma (in cub_family) Ord_sup_greater:
  "Ord(sup_greater(x))"
by (simp add: sup_greater_def next_greater_def)

```

```

lemma all_iff_not_ex_not: " $(\forall x. P(x)) \leftrightarrow (\sim (\exists x. \sim P(x)))$ "
by blast

```

```

lemma ball_iff_not_bex_not: " $(\forall x \in A. P(x)) \leftrightarrow (\sim (\exists x \in A. \sim P(x)))$ "
by blast

```

From the notes of A. S. Kechris, page 6, and from Andrzej Mostowski, *Constructible Sets with Applications*, North-Holland, 1969, page 23.

8.1 Basic Definitions

First part: the cumulative hierarchy defining the class M . To avoid handling multiple arguments, we assume that $Mset(1)$ is closed under ordered pairing provided 1 is limit. Possibly this could be avoided: the induction hypothesis $Cl_reflects$ (in locale $ex_reflection$) could be weakened to $\forall y \in Mset(a). \forall z \in Mset(a). P(\langle y, z \rangle) \longleftrightarrow Q(a, \langle y, z \rangle)$, removing most uses of $Pair_in_Mset$. But there isn't much point in doing so, since ultimately the $ex_reflection$ proof is packaged up using the predicate $Reflects$.

```

locale reflection =
  fixes Mset and M and Reflects
  assumes Mset_mono_le : "mono_le_subset(Mset)"
    and Mset_cont      : "cont_Ord(Mset)"
    and Pair_in_Mset   : "[| x ∈ Mset(a); y ∈ Mset(a); Limit(a) |]
      ==> <x,y> ∈ Mset(a)"
  defines "M(x) == ∃ a. Ord(a) & x ∈ Mset(a)"
    and "Reflects(Cl,P,Q) == Closed_Unbounded(Cl) &
      (∀ a. Cl(a) --> (∀ x∈Mset(a). P(x) <-> Q(a,x)))"
  fixes F0 — ordinal for a specific value y
  fixes FF — sup over the whole level, y ∈ Mset(a)
  fixes ClEx — Reflecting ordinals for the formula ∃ z. P
  defines "F0(P,y) == μ b. (∃ z. M(z) & P(<y,z>)) -->
    (∃ z∈Mset(b). P(<y,z>))"
    and "FF(P) == λa. ⋃ y∈Mset(a). F0(P,y)"
    and "ClEx(P,a) == Limit(a) & normalize(FF(P),a) = a"

lemma (in reflection) Mset_mono: "i ≤ j ==> Mset(i) ≤ Mset(j)"
apply (insert Mset_mono_le)
apply (simp add: mono_le_subset_def leI)
done

```

Awkward: we need a version of `ClEx_def` as an equality at the level of classes, which do not really exist

```

     $\lambda a x. \forall z \in \text{Mset}(a). Q(a, x, z))"$ 
by (unfold rall_def, blast)

```

No point considering bounded quantifiers, where reflection is trivial.

8.5 Simple Examples of Reflection

Example 1: reflecting a simple formula. The reflecting class is first given as the variable `?Cl` and later retrieved from the final proof state.

```

lemma (in reflection)
  "Reflects(?Cl,
     $\lambda x. \exists y. M(y) \ \& \ x \in y$ ,
     $\lambda a x. \exists y \in \text{Mset}(a). x \in y)$ "
by fast

```

Problem here: there needs to be a conjunction (class intersection) in the class of reflecting ordinals. The `Ord(a)` is redundant, though harmless.

```

lemma (in reflection)
  "Reflects( $\lambda a. \text{Ord}(a) \ \& \ \text{ClEx}(\lambda x. \text{fst}(x) \in \text{snd}(x))$ , a),
     $\lambda x. \exists y. M(y) \ \& \ x \in y$ ,
     $\lambda a x. \exists y \in \text{Mset}(a). x \in y)$ "
by fast

```

Example 2

```

lemma (in reflection)
  "Reflects(?Cl,
     $\lambda x. \exists y. M(y) \ \& \ (\forall z. M(z) \longrightarrow z \subseteq x \longrightarrow z \in y),$ 
     $\lambda a \ x. \exists y \in \text{Mset}(a). \forall z \in \text{Mset}(a). z \subseteq x \longrightarrow z \in y)$ "
  by fast

```

Example 2'. We give the reflecting class explicitly.

```

lemma (in reflection)
  "Reflects
    ( $\lambda a. (\text{Ord}(a) \ \&$ 
       $\text{ClEx}(\lambda x. \sim (\text{snd}(x) \subseteq \text{fst}(\text{fst}(x)) \longrightarrow \text{snd}(x) \in \text{snd}(\text{fst}(x))),$ 
       $a)) \ \&$ 
       $\text{ClEx}(\lambda x. \forall z. M(z) \longrightarrow z \subseteq \text{fst}(x) \longrightarrow z \in \text{snd}(x), \ a),$ 
       $\lambda x. \exists y. M(y) \ \& \ (\forall z. M(z) \longrightarrow z \subseteq x \longrightarrow z \in y),$ 
       $\lambda a \ x. \exists y \in \text{Mset}(a). \forall z \in \text{Mset}(a). z \subseteq x \longrightarrow z \in y)$ "
  by fast

```

Example 2''. We expand the subset relation.

```

lemma (in reflection)
  "Reflects(?Cl,
     $\lambda x. \exists y. M(y) \ \& \ (\forall z. M(z) \longrightarrow (\forall w. M(w) \longrightarrow w \in z \longrightarrow w \in x) \longrightarrow$ 
 $z \in y),$ 
     $\lambda a \ x. \exists y \in \text{Mset}(a). \forall z \in \text{Mset}(a). (\forall w \in \text{Mset}(a). w \in z \longrightarrow w \in x) \longrightarrow$ 
 $z \in y)$ "
  by fast

```

Example 2'''. Single-step version, to reveal the reflecting class.

```

lemma (in reflection)
  "Reflects(?Cl,
     $\lambda x. \exists y. M(y) \ \& \ (\forall z. M(z) \longrightarrow z \subseteq x \longrightarrow z \in y),$ 
     $\lambda a \ x. \exists y \in \text{Mset}(a). \forall z \in \text{Mset}(a). z \subseteq x \longrightarrow z \in y)$ "
  apply (rule Ex_reflection)

```

```

TERM  $\lambda a. ?Cl3(a) \ \wedge$ 
       $\text{ClEx}(\lambda x. \forall z. M(z) \longrightarrow z \subseteq \text{fst}(x) \longrightarrow z \in \text{snd}(x),$ 
       $a) \ \&\&\&$ 

Reflects
  ( $\lambda a. ?Cl3(a) \ \wedge$ 
     $\text{ClEx}(\lambda x. \forall z. M(z) \longrightarrow z \subseteq \text{fst}(x) \longrightarrow z \in \text{snd}(x), \ a),$ 
     $\lambda x. \exists y. M(y) \ \wedge \ (\forall z. M(z) \longrightarrow z \subseteq x \longrightarrow z \in y),$ 
     $\lambda a \ x. \exists y \in \text{Mset}(a). \forall z \in \text{Mset}(a). z \subseteq x \longrightarrow z \in y)$ 
  1. Reflects
    ( $?Cl3, \ \lambda x. \forall z. M(z) \longrightarrow z \subseteq \text{fst}(x) \longrightarrow z \in \text{snd}(x),$ 
     $\lambda a \ x. \forall z \in \text{Mset}(a). z \subseteq \text{fst}(x) \longrightarrow z \in \text{snd}(x))$ 

  apply (rule All_reflection)

```

```

TERM λa. (?Cl5(a) ∧
  ClEx(λx. ¬ (snd(x) ⊆ fst(fst(x)) →
    snd(x) ∈ snd(fst(x))),
    a)) ∧

    snd(x) ∈ snd(fst(x))),
    a)) ∧
  ClEx(λx. ∀z. M(z) → z ⊆ fst(x) → z ∈ snd(x),
    a) &&&

Reflects
(λa. (Ord(a) ∧
  ClEx(λx. ¬ (snd(x) ⊆ fst(fst(x)) →
    snd(x) ∈ snd(fst(x))),
    a)) ∧
  ClEx(λx. ∀z. M(z) → z ⊆ fst(x) → z ∈ snd(x), a),
  λx. ∃y. M(y) ∧ (∀z. M(z) → z ⊆ x → z ∈ y),
  λa x. ∃y∈Mset(a). ∀z∈Mset(a). z ⊆ x → z ∈ y)

No subgoals!

```

done

Example 3. Warning: the following examples make sense only if P is quantifier-free, since it is not being relativized.

lemma (in reflection)

```

"Reflects(?Cl,
  λx. ∃y. M(y) & (∀z. M(z) --> z ∈ y <-> z ∈ x & P(z)),

  λa x. ∃y∈Mset(a). ∀z∈Mset(a). z ∈ y <-> z ∈ x & P(z))"

```

by fast

Example 3'

```
lemma (in reflection)
  "Reflects(?Cl,
    λx. ∃y. M(y) & y = Collect(x,P),
    λa x. ∃y∈Mset(a). y = Collect(x,P))"
by fast
```

Example 3''

```
lemma (in reflection)
  "Reflects(?Cl,
    λx. ∃y. M(y) & y = Replace(x,P),
    λa x. ∃y∈Mset(a). y = Replace(x,P))"
by fast
```

Example 4: Axiom of Choice. Possibly wrong, since Π needs to be relativized.

```
lemma (in reflection)
  "Reflects(?Cl,
    λA. 0∉A --> (∃f. M(f) & f ∈ (Π X ∈ A. X)),
    λa A. 0∉A --> (∃f∈Mset(a). f ∈ (Π X ∈ A. X)))"
by fast

end
```

9 The meta-existential quantifier

theory *MetaExists* imports *Main* begin

Allows quantification over any term having sort *logic*. Used to quantify over classes. Yields a proposition rather than a FOL formula.

definition

```
ex :: "(('a::{}) => prop) => prop" (binder "?? " 0) where
  "ex(P) == (!!Q. (!!x. PROP P(x) ==> PROP Q) ==> PROP Q)"
```

15.2 An Injection from Formulas into the Natural Numbers

There is a well-known bijection between $\text{nat} \times \text{nat}$ and nat given by the expression $f(m,n) = \text{triangle}(m+n) + m$, where $\text{triangle}(k)$ enumerates the triangular numbers and can be defined by $\text{triangle}(0)=0$, $\text{triangle}(\text{succ}(k)) = \text{succ}(k + \text{triangle}(k))$. Some small amount of effort is needed to show that f is a bijection. We already know that such a bijection exists by the theorem *well_ord_InfCard_square_eq*:

$$\llbracket \text{well_ord}(A, r); \text{InfCard}(|A|) \rrbracket \implies A \times A \approx A$$

However, this result merely states that there is a bijection between the two sets. It provides no means of naming a specific bijection. Therefore, we conduct the proofs under the assumption that a bijection exists. The simplest way to organize this is to use a locale.

Locale for any arbitrary injection between $\text{nat} \times \text{nat}$ and nat

```
locale Nat_Times_Nat =
  fixes fn
  assumes fn_inj: "fn ∈ inj(nat*nat, nat)"
```

```
consts   enum :: "[i,i]=>i"

15.3 Defining the Wellordering on $DPow(A)$

The objective is to build a wellordering on $DPow(A)$ from a given one on A . We first introduce wellorderings for environments, which are lists built over A . We combine it with the enumeration of formulas. The order type of the resulting wellordering gives us a map from (environment, formula) pairs into the ordinals. For each member of $DPow(A)$, we take the minimum such ordinal.

definition

```
env_form_r :: "[i,i,i]=>i" where
  — wellordering on (environment, formula) pairs
  "env_form_r(f,r,A) ==
    rmult(list(A), rlist(A, r),
          formula, measure(formula, enum(f)))"
```

definition

```
env_form_map :: "[i,i,i,i]=>i" where
  — map from (environment, formula) pairs to ordinals
  "env_form_map(f,r,A,z)
    == ordermap(list(A) * formula, env_form_r(f,r,A)) ' z"
```

definition

```
DPow_ord :: "[i,i,i,i,i]=>o" where
  — predicate that holds if  $k$  is a valid index for  $X$ 
  "DPow_ord(f,r,A,X,k) ==
     $\exists env \in list(A). \exists p \in formula.$ 
    arity( $p$ )  $\leq succ(length(env))$  &
     $X = \{x \in A. sats(A, p, Cons(x, env))\}$  &
    env_form_map(f,r,A,<env,p>) =  $k$ "
```

definition

```
